CAMPERS

SELF-SUFFICIENT 2 SLEEPER CAMPER

In our 15 years of building and developing off-road equipment, we have been evolving our builds to finding the perfect solution for the serious over-lander. It is almost impossible to cover every explorers needs when it comes to over-landing. However, in our quest to build a camper that finds the perfect solution. We have tried to consider a large majority of adventurers needs. While working around a variety of different climates and off-road conditions. We therefore needed to consider a number of key factors. Before we even began to consider others needs we had to stick to our game plan and that is "built Tough" for us the only way we have found this to be really successful is to create an extruded aluminium skeletal frame, before going any further with the design. This has always given us the ideal base to build it strong but still keep the weight as light as possible. We followed a number of key points: First and foremost on our spec list... We needed to make this camper drive off. Why would we would we want to do this? Well there are some obvious reasons. The cost of our pickups (trucks) these days one does not want to invest all this money in a vehicle and be restricted to its use. By being able to leave your camper at home when not in use, is the perfect solution. What makes it even better is the ability to interchange the Khaya between vehicles. This then also vastly increases the value of the camper for resale purposes. The camper needed to offer internal and external living for two people. Although the internal living as you would expect is somewhat limited considering the space restraints, it still offers the ability to climb from your bed into your living space without the need to climb outside first. This means that in adverse climate conditions you are not having to clamber through rain or snow or flash your birthday suite to fellow campers when getting out of bed. Provisions have been made for hot water, and depending on your local by-laws they influence the specific unit you are able to request and or install. Electrical options. We can supply fully wired.

Other options include: cupboard equipped with recovery equipment and would also offer extra space for the storage of tools and extra emergency gear, a pull-out shower rail that connects to the shower tray from off the rear door. A Shadow Awning with side wall kit can be added, which then adds a full room around the camper therefor doubling up as an extra room.

Also, table under roof overhang, side slide table for alongside the kitchen, Wood or rubbish box to mount to the roof in front of the Khaya camper. Spare wheel carrier to fit a second spare wheel to the rear of the camper. Load bars on the roof of the camper to carry bike racks or a small boat. Racktray for the option to mount some added extra gear onto the roof. Things like ammo boxes, or wood for inside the parks.

As you can see from the descriptions given here on the Khaya the full package makes up a rather extensive rig that allows one to head off into the great unknown with just about every essential piece of equipment one needs to make exploring the bush the ultimate experience.

TECHNICAL FEATURES

DIMENSIONS

LENGTH (overall)	2 800mm
HEIGHT (overall, roof closed)	1 450 mm
WIDTH (overall)	1 850mm
HEIGHT (overall, roof opened)	3 100mm
ROOF BED SIZE (roof top tent bed)	2 500 x 1 400mm
DRY WEIGHT (basic shell)	340kg
FULLY KITTED WEIGHT	490kg without the battery and fridge
COLOUR	Silver or Black

BASIC UNIT INCLUDED

Main camper unit: Basic shell with Roof Top tent, bulge box cupboards and front cupboards.

ACCESSORIES LIST

KHAYA SPECIFIC OPTIONS

- Left hand side bench
- Internal cabinet section
- Electrical system: 12V DC + 220V charger
